Springer. Paperback. Book Condition: New. Paperback. 596 pages. Dimensions: 9.2in. x 6.1in. x 1.4in. In a general way, percolation might be defined as a process in which at least two phases, one continuous and the other dispersed, are in bulk relative movement and exchange heat and/or mass through their interface. In practical terms this covers operations such as adsorption, ion exchange, leaching, washing, fluid-fluid displacement in porous media, deep bed filtration, chromatography. Apart from the fact that the design of these processes is almost empirical we have concluded to the necessity of organizing a Summer School on this topic because 1. Powerful new concepts have emerged in this area in the last decade, centered around unsteady-state, non-linearly coupled, multi component systems, and low energy processes 2. There is, potentially, a phenomenology that is common to all percolation operations, and which even extends to other migration phenomena such as electrophoresis, sedimentation, traffic flow 3. There is a need for a synthetic and didactic approach to these problems and its spreading will be most fruitful for the development of separation science. We have tried to choose lecturers who have, themselves, made significant contributions toward the development of such an approach. The lectures given at the Summer School held at Espinho, Portugal in July 17-29, 1978 were compiled in this volume. It is divided in three parts. In the first part some general and introductory notions common to all operations are presented and chromatography is analysed in detail. This item ships from multiple locations. Your book may arrive from Roseburg, OR, La Vergne, TN. Paperback.
